

THIS LINE MUST MEASURE 150 mm

PRINT AT 100%. Turn OFF 'Fit to page' / 'Shrink oversized pages' / driver scaling.

Then measure the line above with a steel ruler.

reads 150 mm → squares are 22.00 mm, nothing to change.

reads anything else → true square = $22.00 \times (\text{measured} \div 150)$.

Put that in calibration-target.json.

Calibration is self-consistent at ANY scale: a scaled print still gives a perfect reprojection error while making every reconstructed distance wrong by that same percentage. Measuring this line is the only defence.

Mount on something RIGID and FLAT. A curled sheet is not a plane.
